

Message summaries

Connecting the diagnostic device

To connect the diagnostic device to the DTCO 1381:

1. Open the cover (2) on the calibration interface (1) by tilting it to the right.
2. Connect the CTCII (4) to the DTCO 1381 calibration interface using the DTCO diagnostic cable (3).

Tip

Click on the relevant entry in the table of contents to view the error message description.

You can also view the error message summaries. Simply click on a screen display to view the corresponding description. ◀

Type of message

Description

Fault warning message

Meaning:

v pulse output (B7) fault.

Possible cause(s):

The connection cable between the DTCO 1381 and the connected control unit is defective.

The control unit connected to output **B7** is defective.

Output **B7** on the DTCO 1381 is defective.

Action:

Check whether or not the connected control unit carries out active cable monitoring and deactivate if necessary.

Check output **B7** on the DTCO 1381, deactivate B7 monitoring if necessary.

Test the connection cable between the DTCO 1381 and the connected control unit.

Earth short circuit?

+ U_B short circuit?

Check connected control unit (input).

Replace any defective components if necessary.

Remarks:

The monitoring of this fault depends on the DTCO 1381's configuration:

The monitoring of this fault can be activated or deactivated (B7recognise).

Message summaries

028 – Driving without card

DTCO screen display:

```
!e driving
without card 28
```

Example – CTCII display:

```
#ERASE ERROR MEMORY#
1. 028 x 2 !
2. 031 x 4
3. 045 x 1 <
```

1 2 3 4

Use the  and  keys to scroll through the error memory:

- 1** Consecutive number
- 2** Position in error memory
- 3** Number of errors
- 4** Symbol for **error is active**

Important

Stands for error memory code **028** that can be read out using a CTCII.

No workshop card necessary. ◀

Type of message	Description
-----------------	-------------

Event warning message **Meaning:**

Trip without a card or without a valid driver or workshop card in card slot 1 or trip with an invalid card combination in card slots 1 and 2.

Action:

Check whether there is a valid driver or workshop card in card slot 1 or 2. If necessary insert a valid card.
Check whether a company or control card is in card slot 1. Eject the card if necessary.

Message summaries

029 – Card conflict

DTCO screen display:

Example – CTCII display:

Use the  and  keys to scroll through the error memory:

-  1 Consecutive number
-  2 Position in error memory
-  3 Number of errors
-  4 Symbol for **error is active**

Important

Stands for error memory code **029** that can be read out using a CTCII.

No workshop card necessary. ◀

Type of message	Description
-----------------	-------------

Event warning message

Meaning:

Invalid card combination in card slots 1 and 2.
The two tachograph cards must not be inserted at the same time.

Action:

Check the combination of the inserted tachograph cards.

Also see Section 2 in the DTCO 1381 Technical Product Manual.

Message summaries

030 – Overspeed

DTCO screen display:

Example – CTCII display:

Use the  and  keys to scroll through the error memory:

- 1** Consecutive number
- 2** Position in error memory
- 3** Number of errors
- 4** Symbol for **error is active**

Important

Stands for error memory code **030** that can be read out using a CTCII.

No workshop card necessary. ◀

Type of message	Description
-----------------	-------------

Event warning message	<p>Meaning: The programmed maximum speed (Vset) was exceeded for more than 60 seconds.</p> <p>Action: Reduce speed.</p>
-----------------------	---

- 3** Number of errors
- 4** Symbol for **error is active**

Important

Stands for error memory code **036** that can be read out using a CTCII.

No workshop card necessary.

Operation messages are not stored in the DTCO 1381 mass memory. ◀

Type of message	Description
Operation message	<p>Meaning: It is currently not possible to print out or display the required data or a printout that is running has been cancelled.</p> <p>Possible cause(s): The vehicle is moving. Ignition is off (necessary with ADR version). The print head has overheated. Undervoltage or overvoltage. Internal printer interface is occupied with another active procedure, e.g. is currently printing.</p> <p>Action: Repeat the procedure. It is only possible to print out or display data when the vehicle is stationary and the ignition is turned on (only ADR version). If necessary stop the vehicle or turn the ignition on. After printing a large amount of data, the print head temperature is too high. Wait until it has cooled down. Check the DTCO 1381's power supply and if necessary correct: Check the connection plug and cable (connector assignment, loose contact, bad connection). Is the voltage value on terminals 30 and 15 within the specified range? Voltage behaviour on terminals 30 and 15 during start up. Are the values within the specified range?</p> <p>Wait until the active procedure has finished and the internal printer interface is free again. If the error message continues to be displayed in spite of taking the above action, replace the DTCO 1381.</p>

Message summaries

037 – Printout delayed

DTCO screen display:

Example – CTCII display:

Use the  and  keys to scroll through the error memory:

-  Consecutive number
-  Position in error memory
-  Number of errors
-  Symbol for **error is active**

Important

Stands for error memory code **037** that can be read out using a CTCII.

No workshop card necessary.

Operation messages are not stored in the DTCO 1381 mass memory. ◀

Type of message	Description
Operation message	<p>Meaning: It is currently not possible to print out or display the required data or a printout that is running has been cancelled.</p> <p>Possible cause(s): The print head has overheated.</p> <p>Action: After printing a large amount of data, the print head temperature is too high. Wait until it has cooled down. When the cause has been removed, the interrupted or delayed printout procedure is resumed automatically. If the error message continues to be displayed in spite of taking the above action, replace the DTCO 1381.</p>

Message summaries

038 – Drawer open

DTCO screen display:

Example – CTCII display:

Use the  and  keys to scroll through the error memory:

- 1** Consecutive number
- 2** Position in error memory
- 3** Number of errors
- 4** Symbol for **error is active**

Important

Stands for error memory code **038** that can be read out using a CTCII.

No workshop card necessary.

Operation messages are not stored in the DTCO 1381 mass memory. ◀

Type of message	Description
Operation message	<p>Meaning: With one of the following situations the unit detects that the printer drawer is open: Prompt for a tachograph card in card slot 2. Prompt for a printout. During a printout.</p> <p>The tachograph card output is delayed until the printer drawer is closed. A current printout is cancelled, a print request is rejected.</p> <p>Possible cause(s): Printer drawer is open.</p> <p>Action: Check whether the printer drawer is open and if necessary close it. If the error message continues to be displayed in spite of taking the above action, replace the DTCO 1381.</p>

Message summaries

039 – No paper

DTCO screen display:

Example – CTCII display:

Use the  and  keys to scroll through the error memory:

-  Consecutive number
-  Position in error memory
-  Number of errors
-  Symbol for **error is active**

Important

Stands for error memory code **039** that can be read out using a CTCII.

No workshop card necessary.

Operation messages are not stored in the DTCO 1381 mass memory. ◀

Type of message	Description
Operation message	<p>Meaning: During a printout or when a print is requested the unit detects that there is no paper in the printer. The current printout is interrupted and the part that has already been printed is automatically selected or the print request is rejected.</p> <p>Possible cause(s): No printer paper inserted. Printer paper has run out.</p> <p>Action: Check whether the printer drawer is open and if necessary close it.</p> <p>If a new printer paper roll is inserted within one hour, the DTCO 1381 automatically continues with the printout. A message is output in the first two lines of the following printout (line 1: printout start time; line 2: counter of the consecutive printouts).</p> <p>If the error message continues to be displayed in spite of taking the above action, replace the DTCO 1381.</p>

Message summaries

040 – Internal fault (slot 1)

DTCO screen display:

```
040 internal
fault 40
```

Example – CTCII display:

```
#ERASE ERROR MEMORY#

Message summaries

048 – Card not valid (slot 1)

DTCO screen display:

Example – CTCII display:

Use the  and  keys to scroll through the error memory:

- 1** Consecutive number
- 2** Position in error memory
- 3** Number of errors
- 4** Symbol for **error is active**

Important

Stands for error memory code **048** that can be read out using a CTCII.

No workshop card necessary. ◀

Type of message	Description
-----------------	-------------

Event warning message **Meaning:**

The tachograph card inserted in slot 1 (driver 1) has expired or is invalid.

Possible cause(s):

An invalid or expired tachograph card **a)** has been inserted.

When the day changes **b)** the unit detects that an inserted tachograph card is no longer valid.

Action:

Check the tachograph card for validity.

Remarks:

a) You can only insert an expired tachograph card (tachograph card has expired but the certificate is still valid) to print out or display the stored data; after confirming the warning message the tachograph card is read as **read only**.

b) If the day changes when the vehicle is stationary, the corresponding data on the tachograph card is stored and the card is ejected. If the day changes during the trip, the corresponding data on the tachograph card is stored when the trip ends and the card is ejected.

058 – Internal fault (slot 2)

DTCO screen display:

Example – CTCII display:

Use the  and  keys to scroll through the error memory:

- 1** Consecutive number
- 2** Position in error memory
- 3** Number of errors
- 4** Symbol for **error is active**

! **Important**
Stands for error memory code **058** that can be read out using a CTCII.
No workshop card necessary. ◀

Type of message	Description	Additional information
Fault warning message	<p>Meaning: Card mechanical system fault (slot 2, driver 2)</p> <p>Possible cause(s): Card lock not closed General card mechanical system fault</p> <p>Action: Insert the tachograph card again. Request the tachograph card again. Interrupt constant voltage supply (i.e. restart). If the error message continues to be displayed in spite of taking the above action, replace the DTCO 1381.</p> <p>Remarks: The inserted tachograph card may be ejected. This fault is reset after a tachograph card has been inserted correctly.</p>	<p>This warning message is displayed every hour until the cause is removed. This warning message is not stored in the mass memory in Calibration mode.</p>

Message summaries

059 – Card fault (slot 2)

DTCO screen display:

```
x02 card fault
                    59
```

Example – CTCII display:

```
#ERASE ERROR MEMORY#
1. 028 x 2 !
2. 031 x 4
3. 045 x 1 <
1 2 3 4
```

Use the  and  keys to scroll through the error memory:

- 1** Consecutive number
- 2** Position in error memory
- 3** Number of errors
- 4** Symbol for **error is active**

Important

Stands for error memory code **059** that can be read out using a CTCII.

No workshop card necessary. ◀

Type of message	Description
-----------------	-------------

Fault warning message	Meaning: Communication error with inserted tachograph card in slot 2 (driver 2).
-----------------------	--

Possible cause(s):
The tachograph card contacts are soiled.
The workshop card is faulty.
The card slot contacts are soiled.

Action:
Check the tachograph card's contact points.
Check and clean the tachograph card.
Check the DTCO 1381, clean the card slot's contact points if necessary.
Replace any defective components if necessary.

Remarks:
The inserted tachograph card is ejected.

Message summaries

060 – Security breach (slot 2)

DTCO screen display:

Example – CTCII display:

Message summaries

062 – Card not closed (slot 2)

DTCO screen display:

Example – CTCII display:

Use the  and  keys to scroll through the error memory:

- 1** Consecutive number
- 2** Position in error memory
- 3** Number of errors
- 4** Symbol for **error is active**

! **Important**
Stands for error memory code **062** that can be read out using a CTCII.
No workshop card necessary. ◀

Type of message	Description
-----------------	-------------

Event warning message **Meaning:**

When reading in a driver or workshop card (in card slot 2), the unit detects that the card was not removed correctly from the last vehicle or the data is not correctly stored.

Action:

- Check the tachograph card.
- Check the previous EC recording equipment.

Remarks:

The source of the error is not in the current DTCO 1381.

Message summaries

063 – Time overlap (slot 2)

DTCO screen display:

```
!002 time
overlap      63
```

Example – CTCII display:

```
#ERASE ERROR MEMORY#
1. 028 x 2 !
2. 031 x 4
3. 045 x 1 <
```

1 2 3 4

Use the  and  keys to scroll through the error memory:

- 1** Consecutive number
- 2** Position in error memory
- 3** Number of errors
- 4** Symbol for **error is active**

Important

Stands for error memory code **063** that can be read out using a CTCII.

No workshop card necessary. ◀

Type of message	Description
-----------------	-------------

Event warning message **Meaning:**

Negative time difference between this and the last vehicle (slot 2: driver card) (EC recording equipment).

Possible cause(s):

The removal time stored on the card is later than the current system time (= time the card was inserted into the current DTCO 1381), i.e. the time of the current EC recording equipment is slow compared with the time on the previous EC recording equipment.

Action:

Check the current DTCO 1381's UTC time and correct it using a test device if necessary.

Check the UTC time on the previous EC recording equipment. Correct it using a test device if necessary.

Message summaries

064 – Insertion while driving (slot 2)

Message summaries

066 – Card not valid (slot 2)

DTCO screen display:

```
! 02 card not
valid                66
```

Example – CTCII display:

```
#ERASE ERROR MEMORY#
1. 028 x 2 !
2. 031 x 4
3. 045 x 1 <
```

1 2 3 4

Use the  and  keys to scroll through the error memory:

- 1** Consecutive number
- 2** Position in error memory
- 3** Number of errors
- 4** Symbol for **error is active**

Important

Stands for error memory code **066** that can be read out using a CTCII.

No workshop card necessary. ◀

Type of message	Description
-----------------	-------------

Event warning message **Meaning:**

The tachograph card inserted in slot 2 (driver 2) has expired or is invalid.

Possible cause(s):

An invalid or expired tachograph card **a)** has been inserted.

When the day changes **b)** the unit detects that an inserted tachograph card is no longer valid.

Action:

Check whether the tachograph card is valid.

Remarks:

a) You can only insert an expired tachograph card (tachograph card has expired but the certificate is still valid) to print out or display the stored data; after confirming the warning message the tachograph card is read as **read only**.

b) If the day changes when the vehicle is stationary, the corresponding data on the tachograph card is stored and the card is ejected. If the day changes during the trip, the corresponding data on the tachograph card is stored when the trip ends and the card is ejected.

Type of message	Description	Additional information
Other event warning message	<p>Meaning:</p> <p>The management device could not be authenticated; the software upgrade has been cancelled.</p> <p>Action:</p> <p>Check that the management device is working properly. Repeat the software upgrade.</p> <p>Remarks:</p> <p>The DTCO 1381 is not necessarily the cause of this message.</p>	<p>With this message the memory code (MC) is not shown on the DTCO 1381 display.</p>

Message summaries

079 – Upgrade failed error

DTCO screen display:

```
upgrade failed
error #FFFFFFF
```

Example – CTCII display:

```
#ERASE ERROR MEMORY#
1. 028 x 2 !
2. 031 x 4
3. 045 x 1 <
1 2 3 4
```

Use the  and  keys to scroll through the error memory:

- 1** Consecutive number
- 2** Position in error memory
- 3** Number of errors
- 4** Symbol for **error is active**

Important

Stands for error memory code **079** that can be read out using a CTCII.

No workshop card necessary. ◀

Type of message	Description	Additional information
Other event warning message	<p>Meaning:</p> <p>The software upgrade module could not be started; the software upgrade has been cancelled.</p> <p>Possible cause(s):</p> <p>Internal fault of the DTCO 1381.</p> <p>Action:</p> <p>Check the DTCO 1381. Repeat the software upgrade. If the error message continues to be displayed, replace the DTCO 1381.</p>	With this message the memory code (MC) is not shown on the DTCO 1381 display.

Message summaries

080 – Motion conflict

DTCO screen display:

Example – CTCII display:

Use the  and  keys to scroll through the error memory:

-  Consecutive number
-  Position in error memory
-  Number of errors
-  Symbol for **error is active**

! **Important**
Stands for error memory code **080** that can be read out using a CTCII.
No workshop card necessary. ◀

Type of message	Description	Additional information
Event message	<p>Meaning:</p> <p>Vehicle motion evaluation conflict between the sensor and an external signal source</p> <p>Possible cause(s):</p> <p>The IMS function is missing or the IMS configuration (Independent Motion Signal) is not programmed correctly. An operational error may have occurred when loading onto the train or ferry. The KITAS2+ 2171 is defective, the sensor cable is interrupted or disturbed.</p> <p>Action:</p> <p>Check the KITAS2+ 2171 sensor cable. Check the KITAS2+ 2171. Check the IMS function. Check the IMS configuration (Independent Motion Signal). Test the connection line between the DTCO1381 and the vehicle data bus (CAN). Replace the defective component (if necessary).</p>	<p>These warning messages are displayed every hour until the cause is removed.</p>

Message summaries

081 – IMS fault

DTCO screen display:

Example – CTCII display:

Use the  and  keys to scroll through the error memory:

-  1 Consecutive number
-  2 Position in error memory
-  3 Number of errors
-  4 Symbol for **error is active**

! **Important**
Stands for error memory code **081** that can be read out using a CTCII.
No workshop card necessary. ◀

Type of message	Description	Additional Information
Fault message	<p>Meaning:</p> <p>The additional, independent motion signal is missing or not available.</p> <p>Possible cause(s) :</p> <p>CAN bus medium malfunction.</p> <p>Action:</p> <p>Check the IMS function. Test the BUS medium, if necessary using a CAN analysis tool. Test the connection line between the DTCO1381 and the vehicle data bus (CAN). Check the CAN subscriber power supply (T. 30, 15 and 31).</p> <p>Remarks:</p> <p>The DTCO1381 does not have to be the cause of the error. Example: The vehicle is in an area where GPS signal cannot be received (GPS malfunction).</p>	<p>These warning messages are displayed every hour until the cause is removed. These warning messages are not stored in the mass memory in "Calibration" mode.</p>
